

AML/J

Mixed-media data storage for up to 3,024TB of data.

The AML/J automated storage library offers a unique combination of solutions for your large-system data storage needs.

It's the right solution for changing technology because mixing and changing media is easy. Supporting more than a dozen technologies, the AML/J is designed for easy field integration of new drive technologies. And since it supports concurrent operation of different technologies in the same library, older and newer technologies can easily co-exist.

The AML/J is the right solution for data growth because it offers true scalability within a single library. Barrier-free expansion modules let you scale the system easily and economically—from as few as two drives and 400 cartridges to as many as 226 drives and 7,500 cartridges.

Finally, the AML/J is the right solution for enterprise storage because the system makes it easy to share the library between different applications and operating systems. Its multi-host architecture lets the AML/J become a shared network resource. You can also partition the library into user-defined volumes.

Features and Benefits

- Grows economically with your data using a unique barrier-free expansion system that eliminates pass-through ports
- Provides the industry's widest choice of storage technologies, including simultaneous use of different media
- Protects your organization's IT investment by offering an easy migration path to new technologies
- Offers an integrated multi-host architecture that makes it easy to share the library between different applications and operating systems

- Provides for automated data and media management and allows easy remote monitoring and operation
- Supported by one of the industry's premier global networks of integration, logistics, and field support experts
